

through said slot, said wall of said tubular body being flexible, said tubular body having a closed end and an open end, said disk member positioned adjacent said closed end; and

a guide rod non-centrally positioned within said tubular body adjacent said wall of said tubular body, said disk member being slidably attached to said guide rod.

22. (new) The device of Claim 21, said disk member being a solid planar member extending transverse to a longitudinal axis of said tubular body.

23. (new) The device of Claim 21, said slot comprising:

a first slot extending along and through said wall of said tubular body; and

a second slot extending along and through said wall of said tubular body on an opposite side of said tubular body from said first slot.

24. (new) The device of Claim 23, said arm comprising:

a first arm extending through said first slot; and

a second arm extending through said second slot.

25. (new) The device of Claim 21, said guide rod having a plurality of fixing elements, said plurality of fixing elements being suitable for retaining said disk member at a desired position within said tubular body.

26. (new) The device of Claim 25, said guide rod extending for less than an entire length of said tubular body.

27. (new) The device of Claim 21, further comprising:

fixing means positioned interior of said tubular body, said fixing means for setting a position of said disk member within said tubular body along a length of said tubular body.

28. (new) The device of Claim 21, further comprising:

a spring hook affixed to an exterior surface of said tubular body.

29. (new) A device for dispensing sandwiches comprising:

a tubular body having a slot extending longitudinally and through a wall of said tubular body, said tubular body having a closed end and an open end;

a disk member positioned interior of said tubular body, said disk member having an arm extending outwardly therefrom, said arm extending outwardly of said tubular body through said slot, said disk member positioned adjacent said closed end; and

a fixing means positioned interior of said tubular body, said fixing means for setting a position of said disk member within said tubular body along a length of said tubular body, said fixing means comprising a guide rod having a ratcheted surface, said disk member having a hole through which said guide rod extends, said guide rod being non-centrally positioned within said tubular body adjacent said wall of said tubular body, said guide rod extending entirely within said tubular body.

30. (new) The device of Claim 29, said tubular body having an oval cross-section, said wall of said tubular body being flexible.

31. (new) The device of Claim 29, said disk member being a solid planar member extending transverse to a longitudinal axis of said tubular body.

32. (new) The device of Claim 29, said slot comprising:

a first slot extending along and through said wall of said tubular body and a second slot extending along and through said wall of said tubular body on an opposite side of said

tubular body from said first slot, said arm comprising a first arm extending through said first slot and a second arm extending through said second slot.

33. (new) A dispenser device comprising:

a sandwich;

a tubular body having a first slot extending longitudinally and through a wall of said tubular body and a second slot extending longitudinally and through a wall of said tubular body, said first slot being positioned on an opposite side of said tubular body from said second slot, said first and second slots extending for less than an entire length of said tubular body, said tubular body having a closed end and an open end; and

a disk member positioned interior of said tubular body, said disk member having a first arm extending outwardly therefrom, said first arm extending outwardly of said tubular body through said first slot, said disk member having a second arm extending outwardly therefrom, said second arm extending outwardly of said tubular body through said second slot, said sandwich positioned in said tubular body so as to have one end thereof abutting said disk member and an opposite end thereof extending outwardly of said open end, said disk member positioned adjacent said closed end.

34. (new) The device of Claim 33, further comprising:

fixing means positioned interior of said tubular body, said fixing means for setting a position of said disk member within said tubular body along a length of said tubular body.
